

POWER PACKED POWER PACKS!

Our power packs are available in a variety of sizes to suit your applications.

Our most popular model will extend 4 crib jacks 17" in one minute with its 1 gallon per minute output. It has a 5 gallon usable capacity (enough oil to fully extend 20 tall crib jacks) 6 gallon maximum capacity tank, a 5.5hp Honda engine, and is shown with the optional wheel and handle kit for easy movement around the job site. Options include divided manifolds with split-flow pump output and two control valves (to allow you to raise one set of jacks while retracting another set), and the extra manifold and fittings to run double-acting (power extend and power retract) jacks, and two speed pump output for use with dolly and other large capacity jacks.

Our middle power pack has a 10 usable capacity/11 gallon maximum capacity tank that gives it the extra oil needed to extend 50 ton dolly jacks that typically take a full gallon to extend them. The unit also has the 5.5hp Honda engine and a 1 gallon per minute output. It can also be equipped to run double-acting jacks, be set up for split-flow operation, and have a two speed pump output.

Our big power packs are designed to run both crib jacks and dolly/large capacity jacks with its user selectable output of 3 or 5 gallons per minute and 13hp electric start Honda engine. Available with 10 or 15 gallon usable

capacity tanks, these machines can also be equipped for use with double-acting jacks, and for split-flow/divided output and two independent circuits

We also design and build very large output power packs for use with jacks that require large volumes of oil, and all of our power packs can be equipped to operate at 10,000 PSI with gas and electric motors.
